Q1. [2 marks]

Define asymptotic efficiency of an algorithm.

The asymptotic notation is a type of notation blah blah blah blah blah. It is used to measure the fastness of an algorithm.

Q2. [2 marks]

What are the steps involved in Divide and Conquer approach?

[No answer provided]

Q3. [2 marks]

What is meant by a stable sort? Give one example.

I am done writing exam. delete last line clear last line Open source speech to text model for writing exams. So transcription works very well what I need to do now is to implement the proper command I probably think I might need to implement some sort of LLM or some sort of system which understands the context. Based on that, I figure out what is a command and what is part of the actual answer instead of just hard coding the answers or rather the questions directly. Submit answer. submit paper

Q4. [10 marks]

Explain why a reverse sorted array results in worst case time complexity for Insertion Sort. Illustrate with an example.

Fuck you. So I want to submit my answer. Submit answer. END PAPER Submit answer I am ready to submit.

Q5. [10 marks]

What is the Maximum Subarray Problem? Describe the Divide and Conquer approach to solve it and analyse its time complexity.

[No answer provided]
